Subject: CES Update; 090114
Date: Monday, September 1, 2014 10:39:59 PM

CES Environmental Services, Inc.: OSC Moore responded to the site on Sunday evening, August 31, 2014, due to rains on Friday, Saturday, and Sunday believed to potentially overflow into the residential properties south of the facility with site residual contamination. On Monday, September 1, the EPA team used absorbent boom and pads to contain the oily materials within the on-site flooded area at the south end of the property. These measures are temporary and will require additional work on Tuesday, September 2. Stormwater is currently managed by evaporation. This solution will have to be expanded to removing water from the building off-site as well as treating with carbon and discharging to storm drains which is where it would go untreated if it were not to be managed. Stormwater management will be a long-term issue related to this site.
